

Deploy document management services across application virtualization networks.

Document Locator deploys easily across application virtualization networks like Citrix Xen App (formerly Citrix Presentation Server), allowing you to extend the same level of document control and collaboration on a virtualized environment as you get on a traditional server-PC network. Benefits include:

- Simplified IT management.
- New options for remote connectivity.
- Deployment options for Citrix and Citrix plus traditional.

Simplified IT management.

Deploying Document Locator over Citrix allows IT departments to deliver secure Document Management as a service to users without the need to install or manage software on individual users' computers. Installation and configuration take place only on the server and the software is then available to client computers. The result is a decrease in the amount of time and effort required to deploy across an enterprise. Users can still customize their experience of Document Locator just as they would if the software were installed on their local machines.

- Achieve greater control over information and improve regulatory compliance.
- Simplify business continuity planning.

New options for remote connectivity.

Application virtualization networks offer additional remote access options for extending document management to employees and others working outside the office. In addition to Document Locator's own Web-based remote access, virtualization networks give IT administrators the ability to offer document management as a service without needing to pre-install client software.

Citrix and Citrix plus traditional.

Document Locator can be deployed in both Citrix-only and mixed network environments:

- For businesses operating exclusively on a virtualized network, Document Locator can be deployed at the server level to provide full functionality at the user workstation level.
- For businesses operating in a mixed environment (for example, using Citrix to provide remote access while continuing to use a traditional network in the office), Document Locator can be deployed across both environments simultaneously.

Benefits

- **IT time savings** – Delivers document management as a service without the need to install and manage software on individuals' computers.
- **Leveraged savings** – Maximizes software investment by reducing the need for hardware while extending document management across the enterprise from a central location.
- **Remote access** – Offers document management services remotely outside the office.

Solutions

- **Compliance** – Increase data security and control with centralized management.
- **Workforce mobility** – Creates new options for providing remote access to employees and others working outside the office.
- **Business continuity** – Simplifies disaster recovery and continuity planning.
